The wQMC packges

The maxCutPack

The package includes the wQMC exe file and some examples of input and output files. Instructions for running wQMC are given in that packege.

The wQMC test package

The test package includes scripts for generating the data that is given in the paper.

The script tree_simulation.pl runs a single test.

Command line:

tree_simulation.pl -ntaxa n [-qnum_f q -corr c -w_pcoorect p -mrp_limit t]

Where:

n = size of taxa in the simulation

q = factor number of quartets related to ntaxa

c = percent of non flipped quartets

p = on/off enable weighted/non weighted flips

t = mrp time limit

The script uses external packages:

The paup4 package (http://paup.csit.fsu.edu/): For running MRP and computing the MAST score

The R8s package(http://loco.biosci.arizona.edu/r8s): For generating a random tree

There is a need to change the directories that are located at the beginning of the script to the directories where the package is installed.
